NEWS 1 Web Page for STN Seminar Schedule - N. America
NEWS 2 JUL 02 LMEDLINE coverage updated
NEWS 3 JUL 02 SCISEARCH enhanced with complete author names
NEWS 4 JUL 02 CHEMCATS accession numbers revised
NEWS 5 JUL 02 CA/CAPplus enhanced with utility model patents from China
NEWS 6 JUL 16 CAPplus enhanced with French and German abstracts
NEWS 7 JUL 18 CA/CAPplus patent coverage enhanced
NEWS 8 JUL 26 USPATFULL/USPAT2 enhanced with IPC reclassification
NEWS 9 JUL 30 USGENE now available on STN
NEWS 10 AUG 06 CAS REGISTRY enhanced with new experimental property tags
NEWS 11 AUG 06 BEILSTEIN updated with new compounds
NEWS 12 AUG 06 FSTA enhanced with new thesaurus edition
NEWS 13 AUG 13 CA/CAPplus enhanced with additional kind codes for granted patents
NEWS 14 AUG 20 CA/CAPplus enhanced with CAS indexing in pre-1907 records
NEWS 15 AUG 27 Full-text patent databases enhanced with predefined patent family display formats from INPADOCDB
NEWS 16 AUG 27 USPATOLD now available on STN
NEWS 17 AUG 28 CAS REGISTRY enhanced with additional experimental spectral property data
NEWS 18 SEP 07 STN AnaVist, Version 2.0, now available with Derwent World Patents Index
NEWS 19 SEP 13 FORIS renamed to SOFIS
NEWS 20 SEP 13 INPADOCDB enhanced with monthly SDI frequency
NEWS 21 SEP 17 CA/CAPplus enhanced with printed CA page images from 1967-1998
NEWS 22 SEP 17 CAPplus coverage extended to include traditional medicine patents

NEWS EXPRESS 19 SEPTEMBER 2007: CURRENT WINDOWS VERSION IS V8.2, CURRENT MACINTOSH VERSION IS V6.0c(ENG) AND V6.0Jc(JP), AND CURRENT DISCOVER FILE IS DATED 19 SEPTEMBER 2007.

 AB The gram-neg. plant-pathogenic bacterium *Xanthomonas campestris* pv.
vesicatoria is the causative agent of bacterial spot disease in pepper and
 tomato plants, which leads to economically important yield losses. This
 pathosystem has become a well-established model for studying bacterial
 infection strategies. The whole-genome sequence of the pepper-pathogenic
Xanthomonas campestris pv. *vesicatoria* strain 85-10, which comprises a
 5.17-Mb circular chromosome and four plasmids, is presented. The genome
 has a high G + C content (64.75%) and signatures of extensive genome
 plasticity. Whole-genome comparisons revealed a gene order similar to
 both *Xanthomonas axonopodis* pv. *citri* and *Xanthomonas campestris* pv.
campestris and a structure completely different from *Xanthomonas oryzae*
 pv. *oryzae*. A total of 548 coding sequences (12.2%) are unique to *X.*
campestris pv. *vesicatoria*. In addition to a type III secretion system,
 which is essential for pathogenicity, the genome of strain 85-10 encodes
 all other types of protein secretion systems described so far in gram-neg.
 bacteria. Remarkably, one of the putative type IV secretion systems
 encoded on the largest plasmid is similar to the Icm/Dot systems of the
 human pathogens *Legionella pneumophila* and *Coxiella burnetii*. Comparisons
 with other completely sequenced plant pathogens predicted six novel type
 III effector proteins and several other virulence factors, including
 adhesins, cell wall-degrading enzymes, and extracellular polysaccharides.
 The genome sequences are deposited in GenBank/EMBL/DDBJ under accession
 nos. AM039952 (chromosome), AM039948 (plasmid pXCV2), AM039949 (pXCV19),
 AM039950 (pXCV38), and AM039951 (pXCV183).

AB Methods of modifying heterooligomeric bacterial toxins for therapeutic use are described. The methods involve two modifications of which one is substituting the targeting domain of the target binding subunit to give it a novel cell- or tissue-specificity. The second modification involves changing the proteinase cleavage site of one of the subunits to make it activatable by a novel proteinase, such as one found in the target tissue. In the case of anthrax toxin, where the protective antigen forms a heptamer, more than one variant with a different activation cleavage site can be used. This would limit the formation of the active heptamer to tissues where all the necessary proteinases are present. The development of variants of protective antigen requiring proteolytic activation by a matrix metalloproteinase, urokinase, or furin is demonstrated. Use of these variants in combination to create a heptamer capable of binding lethal factor and killing host cells is demonstrated.

AB Proteins are incorporated into protein or polysaccharide matrixes for use in tissue repair, regeneration and/or remodeling, and/or drug delivery. The proteins can be incorporated so that they are released by degradation of the matrix, enzymic action, and/or diffusion. As demonstrated by the examples, one method is to bind heparin to the matrix by either covalent or non-covalent methods, to form a heparin-matrix. The heparin then non-covalently binds heparin-binding growth factors to the protein matrix. Alternatively, a fusion protein can be constructed which contains a crosslinking region such as a factor XIIIa substrate and the native protein sequence. Degradable linkages may be included between the crosslinking region and the bioactive factor. Incorporation of degradable linkages between the matrix and the bioactive factors can be particularly useful when long-term drug delivery is desired, for example in the case of nerve regeneration, where it is desirable to vary the rate of drug release spatially as a function of regeneration, e.g. rapidly near the living tissue interface and more slowly farther into the injury zone. Addnl. benefits include the lower total drug dose within the delivery system, and spatial regulation of release which permits a greater percentage of the drug to be released at the time of greatest cellular activity.
